Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

- 1. (Original) A test pattern comprising:
 - a first metal structure disposed over a substrate;

one or more intermediate layers disposed above the first metal structure;

a second metal structure disposed above the one or more intermediate layers, wherein at least a portion of the second metal structure is above the first metal structure and the second metal structure is smaller than the first metal structure;

a first via passing through the intermediate layers and connecting the first metal structure to the second metal structure;

one or more third metal structures disposed above the one or more intermediate layers and the first metal structure, and separated from the second metal structure by a dielectric material; and

one or more second vias passing through the intermediate layers and connecting the first metal structure to the third metal structures, each second via located a predetermined radius from the center of the first via.

- 2. (Original) The test pattern as recited in claim 1, wherein the radius is selected to measure an effective vacancy diffusion area.
- (Original) The test pattern as recited in claim 1, further comprising:
 a fourth metal structure disposed on the substrate in close proximity to the first metal

TSM02-1098 Page 2 of 11 Amendment

structure, wherein the one or more intermediate layers are disposed above the fourth metal structure and another portion of the second metal structure is disposed above the fourth metal structure;

a third via passing through the intermediate layers and connecting the fourth metal structure to the second metal structure;

one or more fifth metal structures disposed above the one or more intermediate layers and the fourth metal structure, and separated from the second metal structure by the dielectric material; and

one or more fourth vias passing through the intermediate layers and connecting the fourth metal structure to the fifth metal structures, each fourth via located outside of a predetermined radius from the center of the third via.

- 4. (Original) The test pattern as recited in claim 1, wherein the first via is approximately centered over the first metal structure.
- 5. (Original) The test pattern as recited in claim 1, wherein each second via is connected to a separate third metal structure.
- 6. (Original) The test pattern as recited in claim 1, wherein all of the second vias are connected to a single third metal structure.
- 7. (Original) The test pattern as recited in claim 1, wherein the intermediate layers substantially comprise a dielectric material.
- 8. (Original) The test pattern as recited in claim 7, wherein the dielectric material is a low-k dielectric material.
- 9. (Original) The test pattern as recited in claim 8, wherein the low-k dielectric material is chosen from the group consisting of polymide, silicon oxycarbide, hydrogen silsesquioxane,

methyl silsesquioxane, bezocyclobutene, fluorinated glass, fluorinated aromatic ether, and interpenetrated spin-on glass.

- 10. (Original) The test pattern as recited in claim 1, wherein the first metal structure, second metal structure and third metal structure comprise copper.
- 11. (Original) The test pattern as recited in claim 1, wherein the first via and second vias comprise copper.
- 12. (Original) The test pattern as recited in claim 1, wherein the radius is within a range of about 0.5 μm to about 10 μm .
- 13. (Original) The test pattern as recited in claim 1, wherein the first metal structure has an area selected from a range of about 100 μ m2 to about 500 μ m2.
- 14. (Original) The test pattern as recited in claim 1, wherein the first metal structure planar dimensions are about 20 μm by a multiple of about 3 μm .
- 15. (Original) The test pattern as recited in claim 1, wherein the second metal structure and the one or more third metal structures are separated by a multiple of about 0.5 μ m.
- 16. (Original) The test pattern as recited in claim 1, wherein:

the first metal structure planar dimensions are 20 μ m by a multiple of 3 μ m; the second metal structure planar dimensions are at least 0.11 μ m by 10 μ m; the third metal structure planar dimensions are at least 0.3 μ m by 0.3 μ m;

the second metal structure and the one or more third metal structures are separated by a multiple of 0.5 μm ; and

the first via and second vias have a width of at least $0.1\ \mu m$.

17. (Original) A test pattern comprising:

two or more test substructures; and

each test substructure comprising:

a first metal structure disposed on a substrate;

one or more intermediate layers disposed above the first metal structure;

a second metal structure disposed above the one or more intermediate layers, wherein at least a portion of the second metal structure is above the first metal structure and the second metal structure is smaller than the first metal structure;

a first via passing through the intermediate layers and connecting the first metal structure to the second metal structure;

one or more third metal structures disposed above the one or more intermediate layers and the first metal structure, and separated from the second metal structure by a dielectric material; and

one or more second vias passing through the intermediate layers and respectively connecting the first metal structure to the third metal structures, each second via located outside of a predetermined radius from a center of the first via, which predetermined radius is different for each test substructure.

18. (Original) The test pattern as recited in claim 17, wherein each test substructure further comprises:

a fourth metal structure disposed on the substrate in close proximity to the first metal structure;

wherein the one or more intermediate layers are disposed above the fourth metal structure and another portion of the second metal structure is disposed above the fourth metal structure;

a third via passing through the intermediate layers and connecting the fourth metal structure to the second metal structure;

one or more fifth metal structures disposed above the one or more intermediate layers and the fourth metal structure, and separated from the second metal structure by the dielectric material; and

one or more fourth vias passing through the intermediate layers and respectively connecting the fourth metal structure to the fifth metal structures, each fourth via outside of a predetermined radius from the center of the third via.

19. (Original) The test pattern as recited in claim 17, further comprising two or more test structures, wherein each test structure comprises the two or more test substructures, and wherein the size of the first metal structure is substantially constant for each test substructure and substantially different for each test structure.

20.-25. (Canceled)

26. (New) A test pattern comprising:

two or more test structures, each test structure further comprising:

two or more test substructures, each test substructure further comprising:

a first metal structure disposed on a substrate;

one or more intermediate layers disposed above the first metal structure;

a second metal structure disposed above the one or more intermediate layers,

wherein at least a portion of the second metal structure is above the first metal structure and the second metal structure is smaller than the first metal structure;

a first via passing through the intermediate layers and connecting the first metal structure to the second metal structure;

one or more third metal structures disposed above the one or more intermediate layers and the first metal structure, and separated from the second metal structure by

TSM02-1098 Page 6 of 11 Amendment

a dielectric material; and

one or more second vias passing through the intermediate layers and respectively connecting the first metal structure to the third metal structures, each second via located outside of a predetermined radius form a center of the first via, which predetermined radius is different for each test substructure.

- 27. (New) The test pattern of Claim 26, wherein the area of the first metal structure of the two or more test substructures for any one of the two or more test structures is different from the area of the first metal structure of the two or more test substructures for any other one of the two or more test structures.
- 28. (New) The test pattern of Claim 26 wherein the predetermined radius is selected to measure an effective vacancy diffusion area.
- 29. (New) The test pattern of Claim 26, wherein each of the two or more test substructures further comprises:
- a fourth metal structure disposed on the substrate in close proximity to the first metal structure;

wherein the one or more intermediate layers are disposed above the fourth metal structure and another portion of the second metal structure is disposed above the fourth metal structure;

a third via passing through the intermediate layers and connecting the fourth metal structure to the second metal structure;

one or more fifth metal structures disposed above the one or more intermediate layers and the fourth metal structure, and separated from the second metal structure by the dielectric material; and

one or more fourth vias passing through the intermediate layers and respectively

TSM02-1098 Page 7 of 11 Amendment

connecting the fourth metal structure to the fifth metal structures, each fourth via outside of a predetermined radius from the center of the third via, which radius is different for each test substructure.

- 30. (New) The test pattern of Claim 29 wherein each of the first and fourth metal structures for the two or more test substructures for any one of the test structures have approximately equal area which is different from the area of the first and fourth metal structures for the two or more test substructures for any other one of the test structures.
- 31. (New) The test pattern of Claim 29 wherein the predetermined radius is selected to measure an effective vacancy diffusion area.
